

Supporting responsible AI: discussion paper submission

I believe governing rules or 'laws' should be created to ensure the safety and well being of all citizens.

These governing rules should be simple and easily implemented.

Governing rules for the use of AI:

- No AI entity may impersonate a human by way of replicating the voice, image, or personal characteristics of a human, living or deceased.
[explanation; an AI entity must not take a citizens identity]
- An AI entity must always make it known to anyone interacting with the AI entity that it is not a real human, it must be clear the interaction is with a machine.
[explanation; a citizen can never think they are interacting with another citizen when they are interacting with an AI entity]
- An AI entity must always be identifiable. The operator / owner / provider of the AI entity must be accessible to the user.
[explanation; there must be accountability for the provision of an AI entity]
- The operator / owner / provider of the AI entity is responsible for ensuring no citizen comes to any harm from the use of the AI entity.
[explanation; there must be accountability for the provision of an AI entity]

Definition of AI entity; any technology, hardware ie: mobile phone or computer, internet site, etc., that provides services or interactions driven by AI technologies, processes, data.

Thank you for considering my submission.
